

DESCRIPTION

The Hynix HY57V64820HG is a 67,108,864-bit CMOS Synchronous DRAM, ideally suited for the main memory applications which require large memory density and high bandwidth. HY57V64820HG is organized as 4banks of 2,097,152x8.

HY57V64820HG is offering fully synchronous operation referenced to a positive edge of the clock. All inputs and outputs are synchronized with the rising edge of the clock input. The data paths are internally pipelined to achieve very high bandwidth. All input and output voltage levels are compatible with LVTTL.

Programmable options include the length of pipeline (Read latency of 2 or 3), the number of consecutive read or write cycles initiated by a single control command (Burst length of 1,2,4,8 or Full page), and the burst count sequence(sequential or interleave). A burst of read or write cycles in progress can be terminated by a burst terminate command or can be interrupted and replaced by a new burst read or write command on any cycle. (This pipelined design is not restricted by a '2N' rule.)

FEATURES

- Single 3.3±0.3V power supply
- · All device pins are compatible with LVTTL interface
- JEDEC standard 400mil 54pin TSOP-II with 0.8mm of pin pitch
- All inputs and outputs referenced to positive edge of system clock
- Data mask function by DQM
- Internal four banks operation

- Auto refresh and self refresh
- 4096 refresh cycles / 64ms
- Programmable Burst Length and Burst Type
 - 1, 2, 4, 8 or Full page for Sequential Burst
 - 1, 2, 4 or 8 for Interleave Burst
- Programmable CAS Latency; 2, 3 Clocks

PIN CONFIGURATION

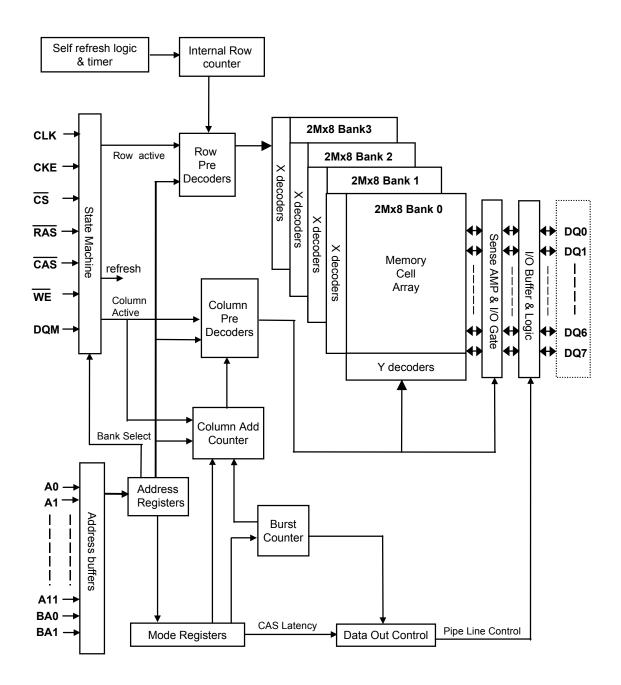

PIN DESCRIPTION

| PIN | PIN NAME | DESCRIPTION |
|--------------|---|--|
| CLK | Clock | The system clock input. All other inputs are registered to the SDRAM on the rising edge of CLK |
| CKE | Clock Enable | Controls internal clock signal and when deactivated, the SDRAM will be one of the states among power down, suspend or self refresh |
| CS | Chip Select | Enables or disables all inputs except CLK, CKE and DQM |
| BA0, BA1 | Bank Address | Selects bank to be activated during RAS activity Selects bank to be read/written during CAS activity |
| A0 ~ A11 | Address | Row Address : RA0 ~ RA11, Column Address : CA0 ~ CA8 Auto-precharge flag : A10 |
| RAS, CAS, WE | Row Address Strobe, Column Address Strobe, Write Enable | RAS, CAS and WE define the operation Refer function truth table for details |
| DQM | Data Input/Output Mask | Controls output buffers in read mode and masks input data in write mode |
| DQ0 ~ DQ7 | Data Input/Output | Multiplexed data input / output pin |
| VDD/VSS | Power Supply/Ground | Power supply for internal circuits and input buffers |
| VDDQ/VSSQ | Data Output Power/Ground | Power supply for output buffers |
| NC | No Connection | No connection |
